

SEASONAL START-UP

Once the seasons change and things start to warm up it is time to start up your equipment. We have put together this guide to help make sure your start up goes smooth.

SEASONAL START-UP TIPS:

CLEAN YOUR EQUIPMENT

When you open everything up or pull out your equipment it is a good idea to pull everything apart and give it a good spray down and cleaning. After a winter of sitting your equipment can be pretty dusty and dirty. Plus this gives you the chance to really look at the status of your equipment.

CHECK ALL THE EQUIPMENT PARTS

It is good to go through and check everything to see if everything is functioning correctly. Check the pumps, sumps, etc, that they are running properly and make sure to check the spraying headers too, they often get clogged and overlooked and can lower the efficiency of your equipment. Basically test everything to make sure you are ready for the heat!

CHECK AND CLEAN MEDIA

It is very important to clean out and check your media before you start up. Evaporative cooling media can last longer with proper care and cleaning. Remember that as you start up your equipment it is important to check your media for buildup and replacement. When your media is not functioning well it affects your equipment and productivity.

REPLACE WHAT NEEDS REPLACEMENT

Early spring is the time to make sure replacement is taken care of. You do not want to wait until the first 100 degree day before you replace any broken or old parts on your equipment. That is especially true for media. Evaporative cooling media is very important to your equipment and will help your equipment perform better and last longer, but only when it is cared for properly, and repacked when needed.
